Introduction

The global automotive industry has experienced significant changes between 2020 and 2025, with electric vehicles (EVs) becoming a popular alternative to traditional petrol and diesel cars. Growing concerns about climate change, air pollution and rising fuel costs have encouraged governments and consumers to consider more environmentally friendly transportation.

According to the International Energy Agency (IEA), global electric car sales increased from approximately 3 million in 2020 to more than 20 million in 2025. This growth has been driven by improvements in battery technology, government incentives, new vehicle models and better charging facilities. China, Europe and the United States have played an important role in expanding the global EV market.

This report analyses global electric vehicle adoption trends from 2020 to 2025, focusing on sales growth, country-wise comparisons and the key factors influencing the industry's development.

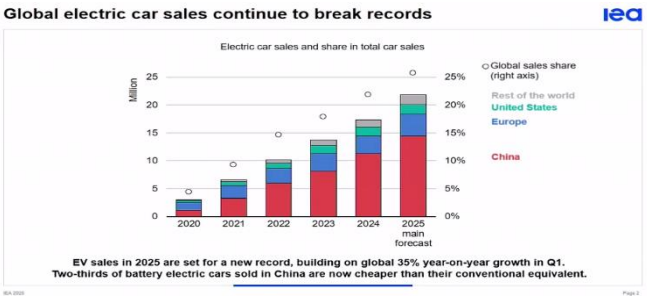

Figure 1: Approximate global electric car sales between 2020 and 2025

Figure 1 shows a clear increase in global electric car sales over the six-year period. Sales grew from approximately 3 million vehicles in 2020 to more than 20 million in 2025. The strongest overall pattern is continuous growth, particularly after 2021. This suggests that electric vehicles have become an increasingly important part of the global automotive market. The increase also indicates growing consumer interest and greater availability of electric vehicle model

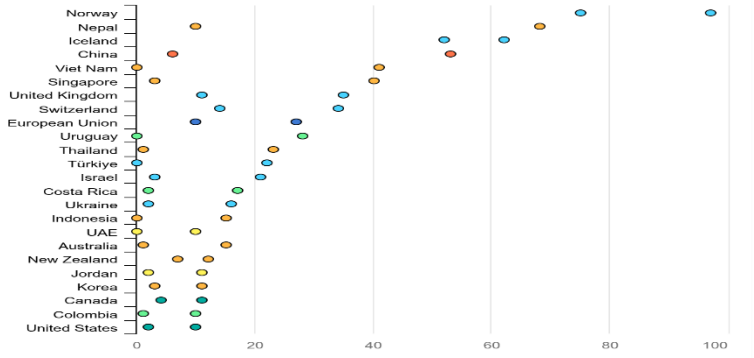

Figure 2: Electric Vehicle Adoption by Selected Countries (2020–2025)

Figure 2 shows the percentage of electric car sales across selected countries between 2020 and 2025. Norway recorded the highest adoption rate, increasing from 75% in 2020 to 97% in 2025, while China showed significant growth from 6% to 53%. The United Kingdom also experienced an increase, reaching 35% in 2025, compared with 11% in 2020. In comparison, the United States recorded a lower adoption rate of approximately 10%. These differences highlight how government support, affordable electric vehicles and charging facilities influence consumer choices. Overall, the data shows that electric vehicle adoption has grown considerably, although the speed of growth varies between countries.

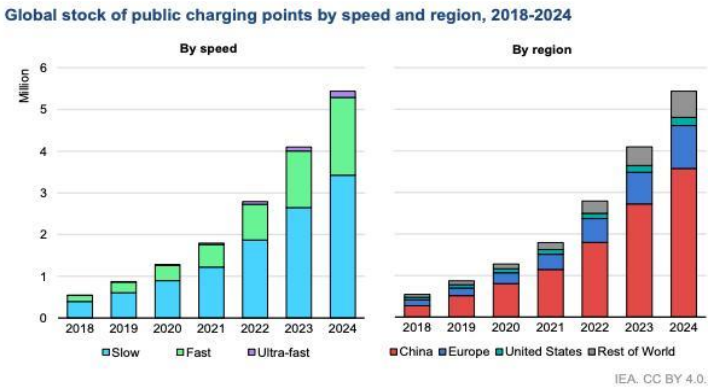

Figure 3 illustrates the growth of public electric vehicle charging points worldwide between 2018 and 2024. The total number of charging points increased significantly during this period, exceeding 5 million in 2024. The growth was driven by the expansion of slow, fast and ultra-fast charging facilities, with fast chargers showing considerable growth. Regionally, China accounted for the largest share of the global charging network, followed by Europe, the United States and the rest of the world. In 2024, China represented approximately 65% of the total public charging points. Overall, the figure highlights the rapid development of global EV charging infrastructure and the increasing investment in charging facilities to support electric mobility.

Conclusion

The analysis of global electric vehicle adoption trends between 2020 and 2025 highlights the rapid growth and development of the electric vehicle industry worldwide. Global electric car sales increased significantly during this period, showing growing consumer interest and wider acceptance of electric mobility. Country-wise comparisons reveal that Norway achieved the highest adoption rate, while China experienced substantial growth in electric vehicle sales. The expansion of public charging infrastructure has also played an important role in supporting this transition, with China accounting for the largest share of global charging points. Overall, improvements in battery technology, government support, affordable vehicle models and the development of charging facilities have contributed to the growth of the EV market. The findings indicate that electric vehicles are becoming an increasingly important part of the global automotive industry and are expected to play a major role in the future of sustainable transportation.
